Preface

Purpose of the Manual

This manual describes the hardware of the SIPROTEC 5 device family and provides general information on the product structure, the modules and technical data.

Target Audience

Protection system engineers, commissioning engineers, persons entrusted with the setting, testing and maintenance of automation, selective protection and control equipment, and operational crew in electrical installations and power plants.

Scope

This manual applies to the SIPROTEC 5 device family.

Further Documentation

- Device manuals
  Each Device manual describes the functions and applications of a specific SIPROTEC 5 device. The printed manual and the online help for the device have the same informational structure.

- Hardware manual
  The Hardware manual describes the hardware building blocks and device combinations of the SIPROTEC 5 device family.

- Operating manual
  The Operating manual describes the basic principles and procedures for operating and assembling the devices of the SIPROTEC 5 range.
• Communication protocol manual
The Communication protocol manual contains a description of the protocols for communication within the SIPROTEC 5 device family and to higher-level network control centers.

• Product information
The Product information includes general information about device installation, technical data, limiting values for input and output modules, and conditions when preparing for operation. This document is provided with each SIPROTEC 5 device.

• Engineering Guide
The Engineering Guide describes the essential steps when engineering with DIGSI 5. In addition, the Engineering Guide shows you how to load a planned configuration to a SIPROTEC 5 device and update the functionality of the SIPROTEC 5 device.

• DIGSI 5 online help
The DIGSI 5 online help contains a help package for DIGSI 5 and CFC. The help package for DIGSI 5 includes a description of the basic operation of software, the DIGSI principles and editors. The help package for CFC includes an introduction to CFC programming, basic examples of working with CFC, and a reference chapter with all the CFC blocks available for the SIPROTEC 5 range.

• SIPROTEC 5/DIGSI 5 Tutorial
The tutorial on the DVD contains brief information about important product features, more detailed information about the individual technical areas, as well as operating sequences with tasks based on practical operation and a brief explanation.

• SIPROTEC 5 catalog
The SIPROTEC 5 catalog describes the system features and the devices of SIPROTEC 5.

• Selection guide for SIPROTEC and Reyrolle
The selection guide offers an overview of the device series of the Siemens protection devices, and a device selection table.

Indication of Conformity

This product complies with the directive of the Council of the European Communities on harmonization of the laws of the Member States relating to electromagnetic compatibility (EMC Council Directive 2014/30/EU) and concerning electrical equipment for use within specified voltage limits (Low Voltage Directive 2014/35/EU).
This conformity has been proved by tests performed according to the Council Directive in accordance with the product standard EN 60255-26 (for EMC directive) and with the product standard EN 60255-27 (for Low Voltage Directive) by Siemens AG.
The device is designed and manufactured for application in an industrial environment.
The product conforms with the international standards of IEC 60255 and the German standard VDE 0435.

Other Standards
IEEE Std C 37.90
The technical data of the product is approved in accordance with UL.
For more information about the UL database, see certified.ul.com
Select Online Certifications Directory and enter E194016 as UL File Number.
Additional Support

For questions about the system, please contact your Siemens sales partner.

Support

Our Customer Support Center provides a 24-hour service.
Phone:  +49 (180) 524-7000
Fax:     +49 (180) 524-2471
E-Mail:  support.energy@siemens.com

Training Courses

Inquiries regarding individual training courses should be addressed to our Training Center:

Siemens AG
Siemens Power Academy TD

Humboldtstraße 59
90459 Nürnberg
Germany

Phone:  +49 (911) 433-7415
Fax:     +49 (911) 433-7929
E-Mail:  poweracademy@siemens.com
Internet: www.siemens.com/poweracademy

Notes on Safety

This document is not a complete index of all safety measures required for operation of the equipment (module or device). However, it comprises important information that must be followed for personal safety, as well as to avoid material damage. Information is highlighted and illustrated as follows according to the degree of danger:

---

**DANGER**

*DANGER* means that death or severe injury will result if the measures specified are not taken.

✧ Comply with all instructions, in order to avoid death or severe injuries.

---

**WARNING**

*WARNING* means that death or severe injury may result if the measures specified are not taken.

✧ Comply with all instructions, in order to avoid death or severe injuries.

---

**CAUTION**

*CAUTION* means that medium-severe or slight injuries can occur if the specified measures are not taken.

✧ Comply with all instructions, in order to avoid moderate or minor injuries.
NOTICE

NOTICE means that property damage can result if the measures specified are not taken.

◊ Comply with all instructions, in order to avoid property damage.

NOTE

Important information about the product, product handling or a certain section of the documentation which must be given particular attention.

Qualified Electrical Engineering Personnel

Only qualified electrical engineering personnel may commission and operate the equipment (module, device) described in this document. Qualified electrical engineering personnel in the sense of this manual are people who can demonstrate technical qualifications as electrical technicians. These persons may commission, isolate, ground and label devices, systems and circuits according to the standards of safety engineering.

Proper Use

The equipment (device, module) may be used only for such applications as set out in the catalogs and the technical description, and only in combination with third-party equipment recommended and approved by Siemens.

Problem-free and safe operation of the product depends on the following:

• Proper transport
• Proper storage, setup and installation
• Proper operation and maintenance

When electrical equipment is operated, hazardous voltages are inevitably present in certain parts. If proper action is not taken, death, severe injury or property damage can result:

• The equipment must be grounded at the grounding terminal before any connections are made.
• All circuit components connected to the power supply may be subject to dangerous voltage.
• Hazardous voltages may be present in equipment even after the supply voltage has been disconnected (capacitors can still be charged).
• Operation of equipment with exposed current-transformer circuits is prohibited. Before disconnecting the equipment, ensure that the current-transformer circuits are short-circuited.
• The limiting values stated in the document must not be exceeded. This must also be considered during testing and commissioning.
Open Source Software

The product contains, among other things, Open Source Software developed by third parties. The Open Source Software used in the product and the license agreements concerning this software can be found in the Readme_OSS. These Open Source Software files are protected by copyright. Your compliance with those license conditions will entitle you to use the Open Source Software as foreseen in the relevant license. In the event of conflicts between Siemens license conditions and the Open Source Software license conditions, the Open Source Software conditions shall prevail with respect to the Open Source Software portions of the software. The Open Source Software is licensed royalty-free. Insofar as the applicable Open Source Software License Conditions provide for it you can order the source code of the Open Source Software from your Siemens sales contact - against payment of the shipping and handling charges - for a period of at least 3 years since purchase of the Product. We are liable for the Product including the Open Source Software contained in it pursuant to the license conditions applicable to the Product. Any liability for the Open Source Software beyond the program flow intended for the Product is explicitly excluded. Furthermore any liability for defects resulting from modifications to the Open Source Software by you or third parties is excluded. We do not provide any technical support for the Product if it has been modified.

When using DIGSI 5 in online mode, you are provided with the option to go to the main menu Show Open source information and read and display the Readme_OSS file containing the original license text and copyright information.

To do this, the following steps are necessary:

• Switch to online mode.
• Select the device.
• Select online in the menu bar.
• Click Show Open source information.

NOTE
To read the Readme_OSS file, a PDF viewer must be installed on the computer.

In order to operate SIPROTEC 5 devices, a valid DIGSI 5 license is required.

1.1 Advantages of SIPROTEC 5

The devices in the SIPROTEC 5 series are based on the many years of experience gathered with SIPROTEC 4. Extensive improvements have also been integrated. Take note of the differences between the modular and non-modular systems.

The SIPROTEC 5 series is based on a newly developed, flexible modular system that is applicable to all the devices. This results in the following advantageous new features:

- **You save time because of jumperless devices.**
  
  You can set the rated current ranges (1 A, 5 A) electronically. You do not need to open the devices to do this. You can set the thresholds of the binary inputs by setting parameters.

- **The freely configurable, modular device design creates more flexibility.**
  
  You can configure your own device variants in addition to the standard variants. The modular system consists of base and expansion modules, and optional plug-in modules. Thus, you can combine the devices exactly as desired, and the standard variants are expandable. Devices with a size of up to 2-row 19-inches are possible.

- **You save time because of prewired terminal blocks.**
  
  The terminal blocks for connection of the relays, of the binary inputs and outputs and of the current and voltage transformers can be removed and fitted again while wired. This enables the possibility of pre-wiring in the cabinet construction phase. Device replacement is uncomplicated and is possible in a short time.

- **You do not need to open the device to install and replace plug-in modules.**
  
  The slots for the plug-in modules are externally accessible. Communication modules and measuring-transducer modules (for example, 4 x 20-mA measuring-transducer input) can be plugged in at these plug-in module positions.

- **Operation is uncomplicated and intuitive.**
  
  For all modular devices, it is possible to select whether to use a large graphical display, a small display, or no display. The non-modular devices are available with large or small graphical display. The key switches on the expansion module can be selected optionally. The 9 function keys enable a safe and uncomplicated procedure for important operator actions.

- **Multi-colored LEDs ensure safe system management.**
  
  The 16 LEDs on the base module are 2-colored (green/red). Thus, the status of a signal (OK/disrupted) can be shown clearly, for example. There can also be 16 red LEDs on each expansion module.

- **Up to 40 analog channels per device create a greater scope of functions than in SIPROTEC 4.**
  
  Thus, even complex applications such as the 1 1/2 circuit-breaker layout are possible.

---

**NOTE**

For the central busbar protection 7SS85, up to 80 analog channels are possible.
1.2 Modular Systems and Hardware Characteristics

The SIPROTEC 5 series includes both modular and non-modular devices. Modular devices consist of a base module (1/3 of 19 inches) and can be expanded with expansion modules (1/6 of 19 inches). The device type identifier for modular devices is XXX85, XXX86, or XXX87, for example, 7SA86.

Type xxx84 devices have the same hardware properties as the modular devices, but they cannot be expanded with expansion modules.

All non-modular devices consist of just a base module (1/3 of 19 inches) and cannot be expanded with expansion modules (1/6 of 19 inches). The device type identifier for non-modular devices is 7XX82, for example, 7SJ82.

Modular System for Modular Devices

The system is based on a modular structure. A modular device always consists of a base module and optionally of expansion modules. The modules can be selected according to hardware characteristics. These characteristics are:

- Module size
- Type of construction
- Fastening of the on-site operation panel
- Creation of the on-site operation panel
- Input and output module
- Plug-in modules

The modules are available in 2 sizes:

- Base module (1/3 of 19 inches)
- Expansion module (1/6 of 19 inches)

The devices are available in 3 designs: These are:

- Flush-mounting devices with on-site operation panel fitted directly on the device
- Surface-mounting devices with integrated on-site operation panel
- Surface-mounting devices with detached on-site operation panel

The on-site operation panels of the base modules can be selected from 3 variants:

- With a large display, keypad, and 16 two-colored LEDs
- With a small display, keypad, and 16 two-colored LEDs
- Without a display, without a keypad (standard), but with 16 two-colored LEDs

The on-site operation panels of the expansion modules can be selected from 3 variants:

- With 16 monochrome LEDs and 2 key switches
- With 16 monochrome LEDs
- Without display elements

The base modules always contain the power-supply module PS201 and an input and output module IO2XX. The expansion modules contain an input and output module IO2XX or a plug-in module assembly with integrated power supply CB202. The 1st expansion module in the 2nd device row always contains the power-supply module PS203.

The plug-in modules are available for various applications. Plug-in modules can be installed in 1 base module or in 1 expansion module with 1 plug-in module assembly with integrated power supply CB202. You can find more information on the available plug-in module types in chapter 4 Plug-In Modules.
Hardware Characteristics of Non-Modular Devices (7xx82)

A non-modular device always consists of just 1 module (1/3 of 19 inches) and cannot be expanded with expansion modules (1/6 of 19 inches). These hardware characteristics are:

- Module size: 1/3 of 19 in.
- Type of construction: Flush-mounting devices with on-site operation panel fitted directly on the device

The on-site operation panels can be selected from 2 variants:

- With a large display, keypad, and 16 two-colored LEDs
- With a small display, keypad, and 16 two-colored LEDs

The module always contains the power-supply module PS101 and an input and output module IO10X. The input and output module IO10X includes the terminals for current and voltage transformers. Optionally, the module can be equipped an additional input and output module IO110 for extra binary inputs and outputs.

The plug-in modules are available for various applications. You can find more information on the available plug-in module types in chapter 4 Plug-In Modules.

2.1 Flush-Mounting Devices

2.1.1 Description

The flush-mounting devices were conceived for installation in 19-inch racks or special openings in control desks and cabinets. The on-site operation panel is linked permanently to the device.

To remove the screw cover, insert the screwdriver into the slot provided for this.

Loosen the cover by turning it slightly. Pull the cover towards you.

NOTICE

The screw cover can be damaged if it is removed in an incorrect way.

Non-observance of the following measure can result in material damage.

✧ Use a screwdriver to remove the screw cover.
Expansion Module

Figure 2-6  Front View of the Expansion Module

(4) Snap-in spring

NOTE
All on-site operation panels must be connected to one another via the bolt-on contact tabs. The contact tabs are delivered with the expansion modules.
2.2 Surface-Mounting Devices with Integrated On-Site Operation Panel

2.2.1 Description of the Modular Device

NOTE
The basic device structure is described in chapter 2.1.1 Description.

The surface-mounting devices with integrated on-site operation panel were conceived for fitting on a flat wall surface. The on-site operation panel is fastened on the device with a distance frame. The distance frame creates the necessary wiring space for the cable connections.

Figure 2-10 Device Structure

(1) Outer distance frame
(2) Fastening bracket
Figure 2-11  Basic and Expansion Module of the Surface-Mounting Device

(1)  Mounting bracket

NOTE
When a base module is expanded, 2 mounting brackets must be fitted between the on-site operation panels and the distance frame. The mounting bracket stabilizes the device. The length of the mounting bracket corresponds to the width of the device.
Fastening Openings

Figure 2-12  Fastening Openings of the Base Module

(1) Top fastening openings
(2) Bottom fastening openings

2.2.2  Description of the Non-Modular Surface-Mounting Device

NOTE
The basic device structure is described in chapter 2.1.1 Description.

The non-modular device variant is designed for mounting to a flat wall surface. This variant is created by flush-mounting the non-modular device into the surface-mounting bracket. In this process, you may face the opening as needed upward (cables coming from above) or downward (cables coming from below) as shown in the following figure. You can order the surface-mounting bracket individually.
Figure 2-13 Bracket with the Opening Upward (Left) and the Opening Downward (Right)

Figure 2-14  Surface-Mounting Version of the Non-Modular Device, Mounted

Figure 2-15  Fastening Openings of the Bracket
2.3 Surface-Mounting Devices with Detached On-Site Operation Panel

2.3.1 Description

NOTE
The basic device structure is described in chapter 2.1.1 Description.

The surface-mounting devices with detached on-site operation panel are a variant of the surface-mounting devices with an integrated on-site operation panel. The essential difference is that you can fit the on-site operation panel separately from the device. The distance frames are not assembled in this device type.

Base Module

The distance between the installation location of the device and that of the on-site operation panel is limited to not more than 5 m (196.85 in) by the length of the connecting cable. The on-site operation panel must be grounded.

2.4 On-Site Operation Panels

2.4.1 Description

Operating Concept

The operating concept is based on 4 groups:

- Navigation in the menu tree
- Modification of settings
- Display of measured values and protocols
- Control function from menu bar or control image

Operating personnel are informed about the current state of important measured data, indications, and parameters. The data can be read out. You can perform parameterization and switching operations directly on the device.

User Interface Language

You can set the user interface language to the following:

- Local language
- US English
- IEC 61850

Variants

Corresponding to the equipment configuration, 3 variants are available for each size. In the case of the non-modular devices, only the front variants with small and large display are available.

Figure 2-19 Variants 1/3 Devices
2.4.2 Overview of Operating Elements and Display Elements

On-Site Operation Panel of the Base and 1/3 Module

(3) Keypad with navigation keys
(4) Softkey
(5) Keypad with numerical keys and shiftable function keys
(6) Keypad of control keys
(7) USB port cover
(8) Cover labels
The on-site operation panels are distinguished by the following characteristics:

- Flat and compact design
- LCD (Liquid Crystal Display) graphics display
  - Small with 192 x 128 pixels for showing measured values and small control displays
  - Large with 240 x 320 pixels for showing measured values and control displays
- Membrane keypad
- Menu navigation function keys
- USB port, type B for notebook/PC
- 16 two-colored LEDs (parameterizable)

The operating elements and display elements of the on-site operation panel for base modules are explained in the following table.

<table>
<thead>

![Expansion Module](image4)

- **1**: 16 monochrome LEDs
- **2**: Cover labels
- **3**: 2 key switches
- **4**: 8 monochrome LEDs
- **5**: 8 push-buttons
The on-site operation panels are distinguished by the following characteristics:

- Flat and compact design
- 16 monochrome parameterizable LEDs
- Decorative film
- 2 key switches for setting the operating mode

Besides the base module, you can add an expansion module with key switches. The following table explains the meanings of the switch positions.

<table>
<thead>
<tr>
<th>Operating Element/Display Element</th>

</tr>
<tr>
<td>Interlocking OFF: unlocked operation</td>
<td></td>
</tr>
<tr>
<td>Normal: locked operation with the configured interlocking conditions</td>
<td></td>
</tr>
</tbody>
</table>

The on-site operation panel with push-buttons is equipped with 8 LEDs and 8 function keys. It can be used as an on-site operation panel by almost all the I/O modules (except for the modules IO230, IO231). The push-button module must be placed in the 1st row at position 3. If the device has a key switch, then the push-button module must be placed in the 1st row at position 4. One push-button module is permitted per device.

3.1.2 Power-Supply Module PS201

3.1.2.1 Description

The power-supply module PS201 is always permanently installed in the base module. The central task is to supply power to all modules. The following can be found on the PS201 module:

- 2 positions for plug-in modules (communication modules, measuring-transducer modules)
- Terminals for time synchronization, the on-site operation panel, an integrated Ethernet interface, and a COM link interface
- A 14-pole voltage terminal (3 binary inputs and 3 binary outputs)
- Battery for the CPU.

The power supply of the other modules is established automatically through the plug-in bus connection when they are assembled.

The following 2 variants are available for the rated voltage range:

- DC 24 V to 48 V
- DC 60 V to DC 250 V and AC 100 V to AC 230 V (50 Hz and 60 Hz)
3.1.2.2 Terminals

(7) Plug-in module position F
(8) Grounding terminal
Terminal and Connection Diagram

Figure 3-2   PS201 – Terminal Diagram
Time-Synchronization Terminal

The terminal for time synchronization is located on the D-sub 9 interface (position G). Time synchronization signals for DC 5 V, DC 12 V, and DC 24 V can be processed as an option.

For further information on connecting to time synchronization, see chapter 6.6 Communication Interfaces in the Technical Data.

On-Site Operation Panel Terminal

The terminal for the on-site operation panel of surface-mounted devices is located on the D-sub 15 interface (position H). The on-site operation panel of surface-mounted devices with the local operation panel integrated or detached is connected to this interface.

For further information on connecting the on-site operation panel, see chapter 6.6 Communication Interfaces in the Technical Data.

Integrated Ethernet Interface J (RJ45)

This terminal is used to load the device with DIGSI 5 using Ethernet. This terminal also enables straightforward IEC 61850 Ethernet communication or communication with another protocol via Ethernet, for example, for connecting an external RTD unit.

For further information on the integrated Ethernet interface, see chapter 6.6 Communication Interfaces in the Technical Data.
Ethernet COM Link

The Ethernet connection to the CB202 PCB assembly (plug-in module assembly with integrated power supply) is realized using the RJ45 interface.

The RJ45 interface can be used exclusively for the connection of the CB202 module. This terminal is left unused when no CB202 module is in use.

For further information on the Ethernet COM link, see chapter 6.6 Communication Interfaces in the Technical Data.

3.1.3 Power-Supply Module PS203

3.1.3.1 Description

If you expand the device into the 2nd device row, you need the PS203 power-supply module.

NOTE

The PS203 power-supply module is always supplied with the expansion module and must always be mounted at position 7.

Up to 5 additional expansion modules are possible in the 2nd device row. The scope of delivery of the PS203 power-supply module includes 1 connecting cable for the 2nd device row, 1 angle rail, 1 sealing panel and 1 adapter bracket.

The PS203 power-supply module has no additional functionality. It is used exclusively to supply power to the 2nd device row.

The rated voltage variant of the PS203 power-supply module must always match the PS201 power-supply module of the base module.
3.1.3.2 Terminals

Overview of Terminals

(1) 2-pole terminal to connect power supply
(2) LED: Power On
(3) Grounding terminal

Connection Diagram

Figure 3-4 PS203 – Terminals

Figure 3-5 PS203 – Connection Diagram

Figure 3-6 Connection of External Power Supply
NOTE

When expanding a device with the 2nd device row, you must install the connecting cable for the 2nd device row together with the associated angle rail. All required components are included with a power-supply module PS203.

![Connecting Cable for the 2nd Device Row](image1)

3.1.4 Plug-In Module Assembly with Integrated Power Supply CB202

3.1.4.1 Description

The plug-in module assembly CB202 is a module with an internal power supply. The CB202 module is used in an expansion module. 3 plug-in module positions (M, N and P) are available for installation of plug-in modules. The plug-in modules can be installed in the following arrangements:

<table>
<thead>
<tr>
<th>Configured with</th>
<th>Plug-In Module Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 measuring-transducer modules</td>
<td>M</td>
</tr>
<tr>
<td>Measuring-transducer module</td>
<td>Measuring-transducer module</td>

</tr>
<tr>
<td>Configured with 1 measuring-transducer module and 2 communication modules</td>
<td>M</td>
</tr>
<tr>
<td>Measuring-transducer module</td>
<td>Communication module</td>
</tr>
</tbody>
</table>

Combinations that do not occupy all plug-in module positions are also possible.

NOTE

A communication module cannot be plugged into the plug-in module position M.

The CB202 module communicates with the base module using a communication connection. This communication connection is established with a special connecting cable. This connecting cable (CAT5 FTP patch cable) is always included in the scope of delivery of the CB202 module and need not be ordered separately.

The following 2 variants are available for the rated voltage range:
- DC 24 V to 48 V
- DC 60 V to DC 250 V and AC 100 V to AC 230 V (50 Hz and 60 Hz)

The CB202 PCB assembly assembly can be used in the 1st and 2nd device rows.

LEDs of the RJ45 Terminals

The light-emitting diodes (LEDs) signal the operating state of the communication connection. The operating states are explained in the following table:
### 3.1.4.2 Terminals

#### Overview of Terminals

<table>
<thead>
<tr>
<th>COM Link (RJ45)</th>
<th>Signal</th>
<th>Color</th>
<th>Operating State</th>
</tr>

3.2.2 Input and Output Module IO201

3.2.2.1 Description

The terminals for the following are located on the input and output module IO201:

- 4 current transformers (optionally protection-class current transformers or instrument transformers)
- 8 binary inputs
- 6 binary outputs, of which:
  - 4 high-speed make contacts (type F)
  - 2 high-speed change-over contacts (type F)

The connections are distributed over:

- 1 x 8-pole current terminal
- 3 x 14-pole voltage terminal

3.2.2.2 Terminals

3.2.3 Input and Output Module IO202

3.2.3.1 Description

This input and output module is used as the base measurement module in all protection devices and bay units. One device can contain several IO202 input and output modules. The number of IO202 input and output modules depends on the measured values required. Up to 40 measuring channels are possible for each SIPROTEC device.

The terminals for the following are located on the input and output module IO202:

- 4 current transformers (optionally protection-class current transformers or instrument transformers)
- 4 voltage transformers
- 8 binary inputs
- 6 binary outputs, of which:
  - 4 high-speed make contacts (type F)
  - 2 high-speed change-over contacts (type F)

The connections are distributed over:

- 1 x 8-pole current terminal
- 3 x 14-pole voltage terminal

3.2.5 Input and Output Module IO204

3.2.5.1 Description

The terminals for the following are located on the input and output module IO204:

- 10 binary inputs
- 4 binary outputs with 4 standard make contacts (type S)
- 4 power relays for controlling 2 motors (forward/backward) with a common auxiliary voltage supply $V_{aux^+}$, $V_{aux^-}$

The power relays operate in interlocked mode, that is, only one relay of each switching pair picks up at a time thereby avoiding a power-supply short circuit. Note the polarity specified in the terminal and connection diagram.

The connections are distributed over three 14-pole voltage terminals.
3.2.5.2 Terminals

3.2 Input and Output Modules of the Modular Devices

3.2.15 Input and Output Module IO215

3.2.15.1 Description

This input and output module is used as the base measurement module in all protection devices and bay units. One device can contain several IO215 input and output modules. The number of IO215 input and output modules depends on the measured values required. Up to 40 measuring channels are possible for each SIPROTEC device.

The terminals for the following are located on the input and output module IO215:

- 4 current transformers (optionally protection-class current transformers or instrument transformers)
- 4 voltage transformers for the connection of an isolation amplifier P27000-H1-5011
  Connect each phase of the device via this isolation amplifier with capacitive voltage transformers from the Trench Co. The voltage input is specially designed for a measuring range up to of 7.07 V.
- 8 binary inputs
- 6 binary outputs, of which:
  - 4 high-speed make contacts (type F)
  - 2 high-speed change-over contacts (type F)

The connections are distributed over:

- 1 x 8-pole current terminal
- 3 x 14-pole voltage terminal

3.2.15.2 Terminals

The terminal and connection diagram is identical to the input and output module IO202 in the expansion module.

You can find more information in chapter 3.2.3.2 Terminals, Figure 3-17 and Figure 3-18.
### 3.2.16 Input Module IO230

#### 3.2.16.1 Description

The terminals for the following are located on the IO230 module:
- 48 binary inputs

The connections are distributed over six 10-pole connection terminals.

---

**NOTE**

Note that the IO230 input module has group switching for switching thresholds. The thresholds of the binary inputs can be switched only in groups of 4. 4th group x1 to x4 and 4th group x7 to x10 (x = A, C, D, E, G, H).

---

3.3 Power-Supply Module of Non-Modular Devices (7xx82)

3.3.1 Power-Supply Module PS101

3.3.1.1 Description

The power-supply module PS101 is always permanently installed in the 1/3 module. The following can be found on the PS101 module:

- 2 positions for plug-in modules (communication modules, measuring-transducer modules)
- Terminals for time synchronization and an integrated Ethernet interface
- A 14-pole voltage terminal (3 binary inputs, 3 binary outputs and connection for power supply)
- Battery for the CPU

The following 3 variants are available for the rated voltage range:

- DC 24 V to 48 V
- DC 60 V to 125 V
- DC 110 V to DC 250 V and AC 100 V to AC 230 V (50 Hz and 60 Hz)

3.3.1.2 Terminals

Overview of Terminals

The terminals assigned to the module are identified by the frame in the figure.

Figure 3-61  PS101 – Connection Diagram
Time-Synchronization Terminal

The terminal for time synchronization is located on the D-sub 9 interface (position G). Time synchronization signals for DC 5 V, DC 12 V, and DC 24 V can be processed as an option.

For further information on connecting to time synchronization, see chapter 6.6 Communication Interfaces in the Technical Data.

Integrated Ethernet Interface J (RJ45)

This terminal is used to load the device with DIGSI 5 using Ethernet. This terminal also enables straightforward IEC 61850 Ethernet communication (including GOOSE) or communication with another protocol via Ethernet, for example, for connecting an external RTD unit.

For further information on the integrated Ethernet interface, see chapter 6.6 Communication Interfaces in the Technical Data.

3.4.2 Input and Output Module IO101

3.4.2.1 Description

The terminals for the following are located on the input and output module IO101:

- 4 current transformers (3 transformers always as protection-class current transformers, the 4th optionally as protection-class or instrument transformer)
- 8 binary inputs
- 6 binary outputs, of which:
  - 4 standard make contacts (type S)
  - 2 standard change-over contacts (type S)

The connections are distributed over:

- 1 x 8-pole current terminal
- 2 x 14-pole voltage terminal
3.4.2.2 Terminals

Overview of Terminals

The terminals assigned to the module are identified by the frame in the figure.

4.2 Communication Modules

4.2.1 Overview

SIPROTEC devices can be ordered with factory-installed communication modules. The communication modules can also be installed and replaced in the SIPROTEC devices afterwards. You do not have to open the device for this.

NOTE
The communication modules available for reordering are not preconfigured. Use DIGSI 5 to carry out the functional adjustment to the required protocol application.

The communication modules can be installed in the base module or the 1/3 module and in the expansion module with the plug-in module assembly CB202. A maximum of 2 communication modules each can be installed. You can use only one CB202 in the device.

The plug-in module assembly CB202 is a module with an integrated power supply.

The plug-in module assembly CB202 communicates with the base module via a special connecting cable. This connecting cable (CAT 5 FTP patch cable) is always included in the scope of delivery of the CB202 assembly or the devices containing the CB202 assembly and need not be ordered separately.

Ensure that you route the communication lines separately from network circuits.

(5) Grounding terminal

The following communication modules can be used for SIPROTEC 5:

- **Serial modules**
  
  Application: Communication to the substation automation technology via substation-control protocols Protection interface (only optical serial modules) for interfacing to external communication converters for short direct connections.

  2 different communication protocols or 2 different applications can be operated on serial modules with 2 connections. The IEC 60870-5-103 protocol for the substation automation technology as well as a protection interface, for example, can be operated on a serial optical module for close range with 2 connections.

  Assign the protocol application to the corresponding channel of the communication module with DIGSI 5.
• Ethernet Modules
  Application: Ethernet-based communication to the substation automation technology via substation-control protocols (for example, IEC 61850 and DNP3)
  – Secure communication to DIGSI 5
  – Communication between the devices (IEC 61850-GOOSE)
  – Synchrophasor protocol
  The modules can be operated with or without an integrated switch.

• Long-distance modules
  Application: Direct protection interface communication over long distances using multimode or single-mode optical fibers.

The designation of the modules corresponds to the following scheme, which is typically explained with the module USART-AB-1EL. The module designation consists of 3 blocks.

1st block  Type of module
  USART = Serial module for short or long distance
  ETH = Ethernet module

2nd block  Unique code for the module in the product code of the device
  The code consists of 2 letters.

3rd block  Number and physical design of the connections
  1 = 1 connection (1 channel)
  2 = 2 connections (2 channels)
  EL = Electrical connection
  FO = Fiber-optic connection
  LDFO = Long-distance transmission via fiber-optic cables

4.2.2 Communication Applications of the Plug-In Modules

You can find information on communication applications for the plug-in modules in the following tables.

NOTE
The **USART** and **ETH** plug-in module types may be used in slots E and F in the base module as well as in slots N and P in the CB202 expansion module. They are not intended for use in slot M in the **CB202** expansion module.

### 4.2.3 Serial Modules for Short Distances

#### 4.2.3.1 Special Features of Serial Electrical Modules

The serial electrical modules are equipped with RJ45 connections. These are not Ethernet connections. The serial signals of the RS485 interface are routed to the RJ45 connections (see following figure).

![RJ45 Terminals for the Serial Signals of the RS485 Interface](dwrj45pb-030211-01.tif)

**Figure 4-4**

RJ45 Terminals for the Serial Signals of the RS485 Interface

### Cabling Examples of Devices with Serial Electrical Modules

Serial electrical RS485 connections of devices in the SIPROTEC 5 series can be cabled with low-cost Ethernet patch cables. Special bus cables and adaptors are not needed. Pay attention to the following note if you include devices from the SIPROTEC 4 series in the connection.

**NOTE**

The RS485 interface in devices of the SIPROTEC 4 series is a D-Sub 9 connection with a connected terminal resistor.

If you connect devices from the SIPROTEC 5 series with devices from the SIPROTEC 4 series, then use a Y adaptor with the order designation 7XV5103-2BA00. Complete the connection on the last device with a terminal resistor. For the SIPROTEC 5 device, use a terminal resistor with the order designation RS485-Terminator 7XV5103-5BA00.

![Communication with a Single Master Using an RS485 Bus](dwserma1-030211-04.tif)

**Figure 4-5**

Communication with a Single Master Using an RS485 Bus
The preceding figure shows the cabling using the new RJ45 sockets in a simplified format. The serial RS485 bus can be extended by simply connecting Ethernet patch cables from device to device.

Figure 4-6  Redundant Communication with 2 Masters Using RS485 Bus (for Example, Redundant IEC 60870-5-103 Protocol)

The preceding figure shows the use of both connections on one module for connecting the devices to 2 independent masters following the same principle as with a single master.

Reorders

When reordering serial communication modules, specify the product code for the physical version of the module. The order configurator (IPC configurator) shows you which applications are capable of running on the module:

- Serial
- 1-channel or 2-channel
- Electrical or optical

4.2.4 Serial Modules for Long Distances

4.2.4.1 Application

The optical protection-interface modules are used for long distances over multimode or singlemode optical fibers. In the case of the protection interface, they serve the purpose of point-to-point transmission between 2 devices. One possible application is the transmission of differential protection data. For example, if you wish to transmit only binary data and measured values, you can equip all SIPROTEC devices with these protection interfaces.
The attainable distance in multimode optical fibers is limited by 2 factors.

- **Bandwidth length product**
  Typical for 62.5 μm/125 μm optical fibers: 400 MHz x km to 800 MHz x km
  Typical for 50 μm/125 μm optical fibers: 400 MHz x km to 1200 MHz x km

- **Fiber attenuation**
  The typical attenuation of a 62.5 μm/125 μm optical fiber is from 0.9 dB/km to 1 dB/km for light with the wavelength \( \lambda = 1300 \text{ nm} \). 1.5 dB/km are added for splices, aging and as a reserve. An attenuation of 2.5 dB/km is used for calculation of the distance.

### 4.2.5 Ethernet Modules

#### 4.2.5.1 Operation of Ethernet Modules

The Ethernet modules of the SIPROTEC 5 series can be operated optionally with or without integrated switch function. This applies for the electrical as well as the optical module. This function can be selected via the
parameterization. It is not necessary to make any indication in the order. The optical Ethernet modules are compatible with the EN100 modules of the SIPROTEC 4 series. If the RSTP protocol or the HSR protocol is active, the optical modules of the SIPROTEC 4 series and the SIPROTEC 5 series can be operated in a ring. When using SIPROTEC 4 devices with module firmware ≤ V4.05 and SIPROTEC 5 devices, the maximum allowable number of participants is 30 devices. When using SIPROTEC 4 devices with module firmware ≥ V4.07 and SIPROTEC 5 devices, the maximum allowable number of participants is 40 devices. When using SIPROTEC 5 devices, the maximum allowable number of participants is 40 devices.

**Figure 4-8** shows operation of the Ethernet modules with integrated switch function. All devices of a station are shown which are connected to one another by means of optical fibers. The devices form optical rings. In addition, 2 switches are used on the substation controller for the SICAM PAS. The 2 switches take the requirements for the redundancy into account.

Additional participants with electrical interfaces can also be connected to the SICAM PAS (for example, the DIGSI 5 control PC). An external switch is sufficient. Optical communication modules are primarily used for this topology, as there can be substantial distances between the devices.

If the Ethernet modules are installed in expansion modules with a CB202 PCB assembly, the power supply can be provided with an independent battery. The integrated switch can maintain its function when the device is switched off. The data are transmitted in optical and electric rings. This prevents opening of the ring. The ring continues to operate when 1 or more devices are switched off.

*Figure 4-9* shows the operating mode without integrated switch function. Optionally, the 2nd connection can be connected to the 2nd switch. This connection is shown with a dashed line in *Figure 4-9*. The IP communication is established using the 1st connection here. If this connection fails, the system changes over to the 2nd connection within a few milliseconds. The IP connection is retained practically without interruption using the 2nd switch. This hot-standby connection redundancy increases the availability in such configurations, as shown in the following figure. The information on failure of the protection connection is transmitted to the substation automation technology.
**4.2.5.2 ETH-BA-2EL**

## 4.3 Measuring-Transducer Modules

### 4.3.1 Overview

You can install the measuring-transducer modules in base modules or 1/3 modules (plug-in module positions E and F) and in expansion modules with a CB202 module (plug-in module position M, N, or P).

### 4.3.2 ANAI-CA-4EL

The ports CH1 to CH4 of the measuring-transducer modules are Safety Extra Low Voltage circuits (SELV circuits). For the connection to the measuring-transducer modules, the following conditions apply:

- SELV circuits may be connected only to SELV circuits.
- Ensure that the cables of SELV circuits are routed separately from the supply circuits.
- Use shielded cables.

<table>

</table>

**Connector type**: 8-pin terminal spring

**Differential current input channels**: 4

**Measuring range**: DC -24 mA to +24 mA

**Error limit**: 0.5 % of measuring range

**Input impedance**: 140 Ω

**Conversion principle**: Delta-sigma (16 bit)

**Permissible potential difference between channels**: DC 20 V

**Galvanic separation with respect to ground/housing**: AC 500 V, DC 700 V

**Permissible overload**: DC 100 mA continuously

**Measurement repetition**: 200 ms
## 4.3.3 ARC-CD-3FO

With the module, you can detect an arc in the air-insulated system part of the switchgear by way of an optical arc sensor.

**Comment:**

1. All values in combination with sensors approved by Siemens.
2. Numerical aperture (NA = sin θ (launch angle))

---

**NOTE**

Laser class 1 is maintained in compliance with EN 60825-1 and EN 60825-2 when using 1 mm polymer optical fibers.
5 Working on the Device

5.1 First Steps 140
5.2 Expanding Modular Devices 142
5.3 Plug-In Modules 154
5.4 Arc Sensors for Module: ARC-CD-3FO 159
5.5 Battery 165
5.6 SDHC Memory Card 167
5.7 Installing Current and Voltage Terminals 169
5.1 First Steps

5.1.1 Electrical Inspection

Device Protection

⚠️ DANGER

Danger when connecting the SIPROTEC 5 device

Noncompliance with the safety notes will result in death, severe injury or considerable material damage.

✧ The device must be situated in the operating area for at least 2 hours before you connect it to the power supply for the first time. This prevents condensate from forming in the device.

✧ If the device has been in storage for more than 2 years, connect it to an auxiliary voltage for 1 to 2 days. This will cause the electrolytic capacitors on the printed circuit-board assemblies to form again.

✧ Perform the electrical inspection.

Activating the Battery

ℹ️ NOTE

The battery is covered by a protective film, which also prevents premature discharge. The battery compartment is located on the rear of the base module. You do not have to take the battery out of the compartment in order to remove the protective film.

✧ Pull out the battery compartment including the battery.

✧ Remove the protective film from the battery by simply pulling on the film tab.

✧ Push the battery compartment including the battery back in again.

Grounding a Device

The SIPROTEC 5 devices are protection class I equipment must be connected with the system ground prior to commissioning.

✧ Ground each module with solid low-impedance system grounding (cross-section ≥ 4.0 mm² (≥ 0.16 in²), grounding area ≥ M4, torque: at least 1.2 Nm).

Connecting a Device

✧ Connect all cables and lines. Use the connection diagrams in the Hardware and Device manuals.

✧ Tighten the terminal screws to the prescribed torques (see chapter Tightening Torques for Terminal Screws, Page 200).

Grounding an On-Site Operation Panel

✧ Join several on-site operation panels to one another with firm contact.

Siemens recommends the use of contact washers on painted metal mounting walls. If the mounting wall is not metallic, place a metal layer, for example a metal sheet, between the mounting wall and the on-site operation panels. Then connect this sheet to the system grounding.
Safety Notes

⚠️ DANGER

Danger during electrical inspection

Noncompliance with the safety notes will result in death, severe injury or considerable material damage.

❖ Comply with all given safety notes when carrying out the electrical inspection.
❖ Please note that hazardous voltages are present when you perform the electrical inspection.

❖ During the electrical inspection, check that the device becomes ready for operation once it has been connected to the power supply.

Performing the Electrical Inspection

❖ Connect the power supply.
❖ Activate the power supply.
After (initial) activation, there is no Device Configuration File (CFG) in the device and the device is in fallback mode. The green and red LEDs light up in fallback mode.
❖ Once you have loaded the CFG file into the SIPROTEC 5 device, the green RUN LED lights up continuously and the device is ready for operation.
❖ If the device does not assume the normal operating state (process mode), switch off the power supply. Disconnect the wiring and the grounding.
❖ Pack this device and return it to the manufacturer, stating the defect. Use transport packaging that meets the requirements of standard ISO 2248.
**5.2 Expanding Modular Devices**

**5.2.1 Flush-Mounting Devices**

**5.2.1.1 Basic Rules for Expansion**

**NOTE**

Prepare the following tools for the device expansion:
- Phillips screwdriver size PZ1 and PZ2
- Screwdriver DIN 4 x 0.8
- During assembly, use the prescribed torques (see chapter 6.13 Design Data).

Comply with the following basic rules when extending devices:
- Always fit the base module on the left in the 1st device row.
- Always fit the expansion modules from left to right.
- Always fit the expansion module with the key switches as the 1st module next to the base module.
- Always fit the expansion modules without LEDs last.
- Always install a power-supply module PS203 on the left as the first unit in the 2nd device row.
- Please note that the PS203 must always have the same rated voltage as the base module.
- Install only I/O modules without LEDs in the 2nd device row.
5.2.1.2 Expanding 1st Device Row

Preparation

NOTE
Reordered modules are not contained in the original device configuration. Use DIGSI to perform the corresponding extension in the Hardware and Protocols Editor.
Carry out the steps described in this chapter if you wish to expand an installed device later on with expansion modules.

- Shut down the device.
- Use the screwdriver to carefully bend the left and right spring clips on the rear plate terminals outwards.
- Completely detach the wired current and voltage terminal blocks from the device.
- Remove all communication lines.
- Remove the plastic screw covers.
- Remove the device.
- Expand the cut-out in the control cabinet.
- Then continue with assembly.

Assembling Devices

- Remove the bus cover from the extreme right-hand module of the device to be extended.
- Remove the plastic screw covers from the expansion module.
- Remove the right sealing strips from the base device.
- Place the expansion module on the right next to the device. Insert the 2 hinged angle clips of the expansion module in the cut-outs of the device.
- Slip ring the expansion module in the direction of the device so that the bottom snap-in spring engages.
- Bolt the 2 on-site operation panels of the module to one another through the contact tab.
- Check that the bus connection is screwed on at the extreme right of the expansion module.

Installation and Commissioning

- Reinstall the device.
- Reinstall the plastic screw covers.
- Refasten the terminal blocks and the necessary communication lines.
- Connect the current and voltage blocks of the expansion module.
- Connect any available plug-in modules.
- Use the supplied grounding cable to connect the expansion module with the device and reconnect the device to service ground.
- Extend the device configuration in DIGSI and load this configuration to the device.
- Resume operation of the device.
5.2.1.3 Expanding Devices with 2nd Device Row

Preparation

NOTE
Reordered modules are not contained in the original device configuration. Use DIGSI to perform the corresponding extension in the Hardware and Protocols Editor. Carry out the steps described in this chapter if you want to expand an installed device later on with a 2nd device row.

✧ Shut down the device in the 1st device row.
✧ Use the screwdriver to carefully bend the left and right spring clips on the rear plate terminals outwards.
✧ Completely detach the wired current and voltage terminal blocks from the device.
✧ Remove all communication lines.
✧ Remove the plastic screw covers.
✧ Remove the device from the 1st device row.
✧ Remove the device bus cover from the extreme right-hand expansion module of the device to be extended.
✧ Bolt the sealing plate and the adaptor bracket according to Figure 5-4 on the outer right expansion module of the 1st device row. The sealing plate, adaptor angle, and screws are included with the supply of the power-supply module PS203.
✧ Attach the cable holder for the connecting cable of the 2nd device row to the back side of the angle rail.
✧ Clip the connecting cable into the cable holder.

NOTE
Observe the direction of the connecting cable. Note that the available cable end for the connection of the 2nd device row must be longer than the cable end for the connection of the 1st device row.

✧ Insert the cable in the rubber seals, and introduce the seals in the slot of the angle rail (see Figure 5-3)

Assembling the Devices

✧ Install the angle rail.
✧ Install the 1st device row above the angle rail.
✧ Install the 2nd device row below the angle rail.
✧ Screw the 2 handle moulds of the connecting cable to the 1st and 2nd device row.

NOTE
Make sure that the handle moulds are not rotated during assembly so as not to damage the contact surfaces of the plugs.
5.2 Expanding Modular Devices

Figure 5-2 Expansion with 2nd Device Row

1. Extreme right expansion module of the 1st device row
2. Connecting cable
3. 2nd device row

1. Angle rail
2. 2 Rubber seals

Figure 5-4 Sealing Plate and Adaptor Bracket for the Expansion Module of the 1st Device Row
Device bus of the outermost right expansion module of the 1st device row
Sealing plate
Adaptor angle
2 mounting screws

Installation and Commissioning
❖ Reinstall the plastic screw covers.
❖ Refasten the terminal blocks and the necessary communication lines.
❖ Connect the current and voltage blocks of the expansion module.
❖ Connect any available plug-in modules.
❖ Use the supplied grounding cable to connect the expansion module with the device and reconnect the device to service ground.
❖ Extend the device configuration in DIGSI and load this configuration to the device.
❖ Resume operation of the device.

5.2.2 Surface-Mounting Devices with Integrated On-Site Operation Panel

5.2.2.1 Basic Rules for Expansion

NOTE
Prepare the following tools for the device expansion:
• Phillips screwdriver size PZ1 and PZ2
• Screwdriver DIN 4 x 0.8
• During assembly, use the prescribed torques (see chapter 6.13 Design Data).

Comply with the following basic rules when extending devices:
• Always fit the base module on the right in the 1st device row.
• Always fit the expansion modules from right to left.
• Always fit the on-site operation panel of the base module on the left.
• Always fit the on-site operation panels of the expansion modules from left to right.
• Always fit the on-site operation panel of the expansion module with the key switches in the 1st place next to the on-site operation panel of the base module.
• Always fit the on-site operation panels without LEDs last.
• Join the on-site operation panels to one another with 2 mounting brackets.
• Always install a power-supply module PS203 on the right as the first unit in the 2nd device row.
• Please note that the PS203 must always have the same rated voltage as the base module.
• In the 2nd device row, you do not need any on-site operation panels, mounting brackets, or distance frames.

NOTE
When expanding a device in the 1st device row, order 2 mounting brackets that match the width of the expanded device.
5.2.2.2 Expanding 1st Device Row

Preparation

NOTE

Reordered modules are not contained in the original device configuration. Use DIGSI to perform the corresponding extension in the Hardware and Protocols Editor. Carry out the steps described in this chapter if you wish to expand an installed device later on with expansion modules.

- Shut down the device.
- Detach all on-site operation panels from the distance frames.
- Remove the mounting brackets.

NOTE

If the device is an expanded device, then detach the 2 mounting brackets. You must replace these mounting brackets with 2 new mounting brackets that match the width of the device.

- Use a screwdriver to carefully bend the left and right spring clips on the terminals outwards.
Completely detach the wired current and voltage terminal blocks from the device.
Remove all communication lines.
Remove the device completely.

Assembling the On-Site Operation Panel Into One Block

![On-Site Operation Panel Fitted on Mounting Bracket](image)

Place the 2 mounting brackets intended for expansion in parallel to one another on a flat surface.
Bolt the 1st (left-hand) on-site operation panel to the 2 mounting brackets. Do not firmly tighten the screws.
Place the 2nd on-site operation panel on the right of the 1st one and bolt these panels onto the 2 mounting brackets. Do not firmly tighten the screws. Make sure that the snap-in spring is engaged!
Bolt the 2 operation panels to one another through the contact tab. Do not firmly tighten the screws.
Repeat the last 2 steps for the remaining operation panels. Leave all screws loose.

Assembling Devices

- Remove the distance frame from the expansion module.
- Remove the bus cover from the extreme left-hand module.
- Remove the plastic screw covers from the extreme left-hand module and from the expansion module.
- Place the expansion module on the left next to the device. Insert the 2 hinged angle clips of the expansion module in the cut-outs of the device.
- Swivel the expansion module in the direction of the device so that the bottom snap-in spring engages.
- Bolt the contact tab to the 2 modules.

Installation and Commissioning

- Install the distance frame intended for expansion.
- Wire and, if required, fasten the current and voltage terminal blocks.
- Fit the device back onto the wall without fastened on-site operation panels.
Use the supplied grounding cable to connect the expansion module with the device and reconnect the
device to service ground.

Fasten the connecting cable for the on-site operation panel on the extreme left-hand operation panel of
those on-site operation panels assembled beforehand into a block.

Place the block of assembled operation panels on the distance frames of the device. In doing so, guide
the connecting cable for the on-site operation panel through the cut-outs of the distance frame to the
terminal of the basic module.

Fasten the connecting cable for the on-site operation panel to the basic module.

Bolt the operation panels to the distance frames and firmly tighten the screws.

Tighten all loose screws on the contact tabs and on the mounting brackets.

Reinstall all plastic screw covers.

Extend the device configuration in DIGSI and load this configuration to the device.

Resume operation of the device.

5.2.2.3 Expanding Devices with 2nd Device Row

Preparation

NOTE
Reordered modules are not contained in the original device configuration. Use DIGSI to perform the corre-
sponding extension in the Hardware and Protocols Editor.
Carry out the steps described in this chapter if you wish to expand an installed device later on with expan-
sion modules.

Shut down the device in the 1st device row.

NOTE
The next 6 steps are only necessary if the 1st device row is not accessible.
If the left side of the 1st device row is accessible, then the complete device can remain on the wall.

Detach all on-site operation panels from the distance frames.

Remove the mounting brackets.

Use the screwdriver to carefully bend the left and right spring clips on the rear plate terminals outwards.

Completely detach the wired current and voltage terminal blocks from the device.

Remove all communication lines.

Completely remove the device from the 1st device row.

Remove the device bus cover from the extreme left-hand expansion module of the device to be
extended.

Bolt the sealing plate and the adaptor bracket according to Figure 5-8 on the outer left expansion module
of the 1st device row. The sealing plate, adaptor angle, and screws are included with the supply of the
power-supply module PS203.

Assembling the Devices

Install the 1st device row.
NOTE

The distance between 1st and 2nd device row must be no more than 80 mm (3.15 in).

- Install the 2nd device row.
- Unscrew the captive screws from the handle mould.
- Install the handle mould.
- Install the screws for the handle mould from the view of the adaptor bracket. Thus, later accessibility is ensured without having to remove the entire device.

Figure 5-7 Expansion with 2nd Device Row (View of the Installation Level without Display of the On-site Operation Panel)

(1) Extreme left expansion module of the 1st device row
(2) Connecting cables
(3) 2nd device row

Figure 5-8 Sealing Plate and Adaptor Bracket for the Expansion Module of the 1st Device Row

(1) 2 mounting screws
(2) Adaptor angle
(3) Sealing plate
(4) Device bus of the outermost left expansion module of the 1st device row

Installation and Commissioning

☑ Reinstall the plastic screw covers.
☑ Refasten the terminal blocks and the necessary communication lines.
☑ Connect the current and voltage blocks of the expansion module.
☑ Connect any available plug-in modules.
☑ Use the supplied grounding cable to connect the expansion module with the device and reconnect the device to service ground.
☑ Extend the device configuration in DIGSI and load this configuration to the device.
☑ Resume operation of the device.

5.2.3 Surface-Mounting Devices with Detached On-Site Operation Panel

5.2.3.1 Basic Rules for Expansion

NOTE

Prepare the following tools for the device expansion:
- Phillips screwdriver size PZ1 and PZ2
- Screwdriver DIN 4 x 0.8
- During assembly, use the prescribed torques (see chapter 6.13 Design Data).

Comply with the following basic rules when extending devices:
- Always fit the base module on the right in the 1st device row.
- Always fit the expansion modules from right to left.
- Always fit the on-site operation panel of the base module on the left.
- Always fit the on-site operation panels of the expansion modules from left to right.
- Always install a power-supply module PS203 on the right as the first unit in the 2nd device row.
- Note that the PS203 must always have the same rated voltage as the base module.
- The distance between the device and the on-site operation panel is limited to not more than 5 m (196.85 in) by the length of the connecting cable.
NOTE
Reordered modules are not contained in the original device configuration. Use DIGSI to perform the corresponding extension in the Hardware and Protocols Editor.
Carry out the steps described in this chapter if you wish to expand an installed device later on with expansion modules.

✧ Shut down the device.
✧ Use a screwdriver to carefully bend the left and right spring clips outwards.
✧ Completely detach the wired current and voltage terminal blocks from the device.
✧ Remove all communication lines.
If you want to expand the device, then detach it completely.
If you want to expand the on-site operation panel, then remove the on-site operation panel from the installation space.

NOTE
The device and the on-site operation panel can be expand independently of one another. Therefore, you need only detach those components that are to be expanded.

Installing the Devices (with View to the Installation Plane)
- Remove the bus cover from the extreme left-hand module of the device to be expanded.
- Remove the plastic screw covers from the extreme right-hand module and from the expansion module.
- Place the expansion module on the left next to the device. Insert the 2 hinged angle clips of the expansion module in the cut-out of the device.
- Swivel the expansion module in the direction of the device so that the bottom snap-in spring engages.
- Bolt the on-site operation panels of the 2 modules to one another through the contact tab.
- Check that the bus connection is screwed on at the extreme left of the expansion module.

Assembly and Commissioning
- Reinstall the plastic screw covers.
- Use the supplied grounding cable to connect the expansion module with the device and reconnect the device to service ground.
- Fit the device back onto the wall.
- Expand the on-site operation panel with the on-site operation panel of the expansion modules. Make sure that the bus connection is plugged in reliably and that the snap-in springs have engaged.
- Bolt the on-site operation panels to one another through the contact tab.
- Check that the bus connection on the expansion module on the extreme right is covered.
- Connect all communication lines again.
- Extend the device configuration in DIGSI and load this configuration to the device.
- Resume operation of the device.

Expanding Devices with the 2nd Device Row
- When expanding a surface-mounting device with a 2nd device row, follow the instructions in chapter 5.2.2.3 Expanding Devices with 2nd Device Row.
5.3 Plug-In Modules

5.3.1 Fasteners

The fasteners of the plug-in modules are shown in the following figure regarding the example of an installed module and an empty, covered slot.

![Fasteners Diagram]

5.3.2 Installation

**NOTE**

Reordered modules are not contained in the original device configuration. Use DIGSI to perform the corresponding extension in the Hardware and Protocols Editor.

Preparing Installation

**DANGER**

Danger due to live voltage when installing the plug-in modules.

Noncompliance with the safety notes will result in death or severe injuries.

- Install plug-in modules on the electrically deactivated device only.
CAUTION

Exercise caution with laser beams of the optical plug-in modules.

**Noncompliance with the safety notes can result in medium-severe or slight injuries.**

- Do not look directly into the optical fiber terminals of the active optical plug-in modules, not even with optical devices. The laser beams can damage the eyes.

- De-energize the device.

NOTE

When using optical communication modules, Laser class 1 is maintained in compliance with EN 60825-1 and EN 60825-2 when using optical fibers ≤ 62.5 μm/125 μm.
When using the ARC-CD-3FO module, Laser class 1 is maintained in compliance with EN 60825-1 and EN 60825-2 when using 1 mm polymer optical fibers.

- In the case of a surface-mounted device with integrated on-site operation panel, remove the entire on-site operation panel.
- Undo the fastening screw and remove the cover plate from the plug-in module position.

**Installing the Plug-In Module**

- Push in the plug-in module on the inner guide as far as it will go.
- Ensure that the EMC contact spring is seated correctly.
- Bolt down the plug-in module on the assembly frame to a torque of 0.4 Nm.
- Connect the lines to the terminals.
- Then check for secure attachment of the connectors.
- If necessary, fit the on-site operation panel again.

**Completing Installation**

- Resume operation of the device.

**5.3.3 Removing**

**Accessories**

NOTE

Seal an unused plug-in module position with a cover plate.

- Order the module cover plate set of parts to cover the unused plug-in module position.
Preparing Removal

⚠️ **DANGER**
Risk of live voltage when removing the plug-in modules.

*Noncompliance with the safety notes will result death or severe injuries.*

✧ Remove plug-in modules on the electrically deactivated device only.

⚠️ **CAUTION**
Exercise caution with laser beams of the optical plug-in modules.

*Noncompliance with the safety notes can result in medium-severe or slight injuries.*

✧ Do not look directly into the optical fiber terminals of the active optical plug-in modules, not even with optical devices. The laser beams can damage the eyes.

✧ De-energize the device.

**NOTE**
Laser class 1 is adhered to in compliance with EN 60825-1 and EN 60825-2, in the case of ≤ 62.5 μm/125 μm optical fibers.

✧ In the case of a surface mounting device with integrated on-site operation panel, remove the on-site operation panel before the base module.

Removing the Plug-In Module

✧ Remove all connecting lines.

✧ Undo the fastening screw with which the plug-in module is fixed on the device.

✧ Insert a screwdriver (DIN 4 x 0.8) in the cut-out underneath the oblong hole.

✧ Carefully pull out the plug-in module.

Fastening the Cover Plate

✧ Fasten the cover plate with the fixing screw to a torque of 0.4 Nm. The fixing screw is included in the set of parts.

Completing Removal

✧ In the case of a surface mounting device with integrated local operation panel, fit the on-site operation panel of the base module again.

✧ Resume operation of the device.
5.3.4 Replacement

Preparing for Replacement

**DANGER**
Danger due to live voltage when replacing the plug-in modules.

*Noncompliance with the safety notes will result in death or severe injuries.*

○ Install plug-in modules on the electrically deactivated device only.

**CAUTION**
Exercise caution with laser beams of the optical plug-in modules.

*Noncompliance with the safety notes can result in medium-severe or slight injuries.*

○ Do not look directly into the optical fiber terminals of the active optical plug-in modules, not even with optical devices. The laser beams can damage the eyes.

○ De-energize the device.

**NOTE**
Laser class 1 is adhered to in compliance with EN 60825-1 and EN 60825-2, in the case of ≤ 62.5 μm / 125 μm optical fibers.

When using the ARC-CD-3FO module, Laser class 1 is maintained in compliance with EN 60825-1 and EN 60825-2 when using 1-mm plastic optical fibers.

○ In the case of a surface-mounted device with integrated on-site operation panel, remove the on-site operation panel before the base module.

○ Remove all communication lines.

○ Undo the fastening screw with which the plug-in module is fixed on the device.

○ Insert a screwdriver (DIN 4 x 0.8) in the cut-out underneath the elongated hole in the assembly frame and disengage the plug-in module.

○ Carefully pull out the plug-in module.

Fastening the Plug-In Module

○ Push in the new plug-in module on the inner guide of the plug-in module position until it moves no further.

○ Bolt down the plug-in module on the assembly frame to a torque of 0.4 Nm.

○ Connect the lines to the terminals.

○ Then check for secure attachment of the connectors.

○ If necessary, fit the on-site operation panel again.

Completing Replacement

○ Place the device is service again and perform a firmware update of the communication modules.
NOTE
If you have not cabled the optical fiber plug-in modules, then seal the terminals with protective covers. This prevents soiling of the terminals.
5.4 **Arc Sensors for Module: ARC-CD-3FO**

5.4.1 **Point Sensor**

5.4.1.1 **Description**

The point sensor detects arcs in the control cabinets of the air-insulated system part.

---

Figure 5-12  Point Sensor for the Arc-Protection Module: ARC-CD-3FO

- (1) Optically active zone
- (2) Sensor head
- (3) Supply line
- (4) Plug to the arc-protection module: ARC-CD-3FO
- (5) Expansion rivet, 4x7
- (6) Screw, M4
The sensitivity of the point sensors with line lengths up to 4 m typically begins at 10 kLux.

### 5.4.1.2 Installation

The point sensors are mounted in the different compartments of a control cabinet, see the following figure. The point sensor detects light in an angle of ± 60°.
Installing ARCD3FO Sensors

Preparation of Installation

**CAUTION**
Exercise caution with laser beams of the optical plug-in modules.

*Noncompliance with the safety notes can result in medium-severe or slight injuries.*
- Do not look directly into the fiber-optic terminals of the active optical plug-in modules, not even with optical devices. The laser beams can damage the eyes.
- De-energize the device.

**NOTE**
Laser class 1 is maintained in compliance with EN 60825-1 and EN 60825-2 when using 1 mm polymer optical fibers.

- You need 1 hole in the control cabinet for fastening.

**Mounting the Point Sensor**
- With a wall thickness of 1.5 mm to 2.5 mm, fasten the point sensor using an expansion rivet. This expansion rivet is included in the scope of delivery.
  - Hole diameter = 4.1 mm to 4.2 mm
- Insert the expansion rivet through the hole in the point sensor and through the hole in the wall. Press the head of the expansion rivet firmly into the base body.
- As an alternative, you can also fasten the point sensor using a screw (M4). Tighten the screw with a torque of 0.2 Nm.
- Siemens recommends fastening the line to the wall below the point sensor. The line must not be bent or stressed in any other way.
  - R = 50 mm (minimum bending radius)
  - Maximum continuous tensile force = 1 N

**NOTE**
Order the point sensor with a suitable line length. If the line is too long, it must not be shortened! It must be rolled up with a minimum diameter of 0.3 m because of the optical loss.
- Obey the general recommendations of the manufacturers of optical lines.
- Remove the dust caps from the plug and connect the line to the plug-in module.

**NOTE**
The contact surfaces of the plug must be clean.

- Then check for secure attachment of the plug.

---

SIPROTEC 5, Hardware Description, Manual
Completing Installation

✧ Resume operation of the device.

**NOTE**
In order to warrant safe functioning, the affected sensor must be substituted after detection of an arc.

**NOTE**
Hereby, Siemens declares that until now, UL has neither investigated whether the device can detect an arc-protection fault, neither if in case of an arc-protection fault, the safety of personnel and system is guaranteed.

## 5.4.2 Line Sensor

### 5.4.2.1 Description

The line sensor detects arcs in the control cabinets of the air-insulated system part.

![Figure 5-15 Line Sensor for the Arc-Protection Module ARC-CD-3FO](image)

### 5.4.2.2 Installation

Depending on the application, the line sensor can be, for example, laid along the busbar. Additional point sensors are installed in order to identify the arcs in the circuit-breaker compartment and in the cable connection compartment.
Depending on the possibilities of implementing this in the control cabinet, the line sensor can also be passed through the breaker compartment and the cable connection compartment of the feeders in addition to the busbar compartment.

![Diagram of line sensor layout](image)

**NOTE**
Install the arc sensors in the control cabinet in such a way that the relevant sections are not hidden behind other system components!

### Preparing Installation

**CAUTION**
Exercise caution with laser beams of the optical plug-in modules.

*Noncompliance with the safety notes can result in medium-severe or slight injuries.*

- Do not look directly into the fiber-optic terminals of the active optical plug-in modules, not even with optical devices. The laser beams can damage the eyes.

- De-energize the device.

**NOTE**
Laser class 1 is maintained in compliance with EN 60825-1 and EN 60825-2 when using 1 mm polymer optical fibers.

- You need 2 holes (10.0 mm in diameter) in the control cabinet for fastening. Siemens recommends a distance of approx. 10 cm.
Mounting the Line Sensor

- Fasten both busbar-coupler pieces in both the holes in the control-cabinet wall. The busbar-coupler pieces (incl. nut and lock washer) are included in the scope of delivery for the sensor.
- Connect one end of the line sensor to a busbar-coupler piece and route the sensor fiber along the section to be protected, for example, the busbar.
- Make sure that the piece of fiber exposed to the arc has a minimum size of 0.5 m and that the distance from the potential arc source is a maximum of 0.25 m. If these boundary conditions cannot be satisfied, please contact our Customer Support for further questions.
- Fasten the sensor fiber, for example, with cable fasteners. Ensure that the fiber is not damaged or broken when fastening.
- The sensor fiber is non-conductive. However, ensure that the sensor fiber is laid in such way as to avoid contact with hot or energized parts.
- During installation, make sure that the sensor and the line are not damaged by sharp edges.
- Sensor areas that should not react to light can be covered up.
- Pass the sensor fiber back again and fasten it with the 2nd busbar-coupler piece.
- The line must not be bent or stressed in any other way.
  - R = 50 mm (minimum bending radius)
  - Maximum continuous tensile force = 1 N
- Fasten the supply line with the busbar-coupler piece to the side of the protection device.
- Remove the dust caps from the plug and connect the supply line to the plug-in module.

**NOTE**
Order the line sensor and the supply line with a suitable line length. If the line is too long, it must not be shortened! It must be rolled up with a minimum diameter of 0.3 m because of the optical loss.
Obey the general recommendations of the manufacturers of optical lines.

**NOTE**
The contact surfaces of the plug must be clean.

Completing Installation

- Resume operation of the device.

**NOTE**
In order to warrant safe functioning, the affected sensor must be substituted after detection of an arc.

**NOTE**
Hereby, Siemens declares that until now, UL has neither investigated whether the device can detect an arc-protection fault, neither if in case of an arc-protection fault, the safety of personnel and system is guaranteed.
5.5 Battery

5.5.1 Description

The battery lies in an externally accessible battery compartment. The battery compartment is located on the rear of the base module. You need not open the device when replacing the battery.
If the auxiliary voltage fails, the battery assures continued operation of the internal clock and storage of specific data (statistic values, values of thermal models) for at least 6 months. The parameterization, logs, and fault records are stored in a non-volatile memory and are fail-safe at all times.
The device cyclically checks the charge of the battery. The Battery fault indication is issued if the actual voltage falls below the minimum.
5.5.2 Replacing the Battery

Safety Notes

NOTICE
Exercise caution when replacing the battery.
Noncompliance with the specified measures can result in material damage.
✧ Replace the battery only with the type specified in the Technical Data.

NOTICE
Exercise caution when disposing of the battery. The battery contains lithium. Lithium batteries are subject to the statutory regulations governing the disposal of batteries.
Noncompliance with the specified measures can result in material damage.
✧ Dispose of the battery in compliance with national and international regulations. Hand in the battery at an approved collection point, or dispose of it in the collection bins provided for the purpose.

Error Message on the Device
The Battery fault message is displayed on the device.
✧ Replace the battery.

Replacing the Battery
Use only a battery of the type specified in the Technical Data.
✧ Pull out the battery compartment.
✧ Remove the battery.
✧ Place the new battery in the battery compartment so that the positive pole points upwards.
✧ Push the battery compartment back in again.
✧ Check whether the Battery fault indication is displayed.
✧ The Battery fault message is reset within 24 hours or after switching the device on and off again.
You have replaced the battery successfully if the message is no longer displayed.

NOTE
If you replace the battery without a power supply connected, all battery-backed data will be lost.
5.6 SDHC Memory Card

The SDHC memory card (Secure Digital High Capacity) is used to store records from the 7KE85 fault recorder.

![SDHC Memory Card](image)

**NOTE**
Reading the data of the SDHC memory card with a PC is not intended.
Avoid too frequent insertion cycles!

**NOTE**
Use only the original SDHC memory card (ACCESAR) approved by Siemens for the 7KE85 fault recorder.

Replacing the SDHC Memory Card

- De-energize the device.
- Remove the sealing cap.
- Unlock the card by pressing the turquoise eject lever.

![Removing the Sealing Cap and SDHC Memory Card](image)
Push the holder, push the sealing cap to the back and remove it

Unlock the eject lever

Remove the SDHC memory card

✧ Unpack the new SDHC memory card.
   Do not touch the contacts of the SDHC memory card with your fingers.

✧ Insert the new SDHC memory card.
   When inserting, make sure that the SDHC memory card is properly aligned: The side with the contacts must be facing up, the side with the sticker facing down.

![Inserting the SDHC Memory Card into the Device](image)

**CAUTION**

Exercise caution when removing the SDHC memory card from a defective device.

If you want to remove the SDHC memory card from a defective device and to insert the card into another healthy device and if the data must be kept, note the following:

**Noncompliance with the specified measures can result in loss of data.**

✧ To avoid a reformatting of the SDHC memory card, you must first import the parameters of the defective device to another device.

✧ You can insert the SDHC memory card in the other device and use it only then.

✧ The recordings on the SDHC memory card from the defective device can still be read in the other device.

✧ Insert the sealing cap back again.

✧ Resume operation of the device.
5.7 Installing Current and Voltage Terminals

5.7.1 Description

Figure 5-22  Current and Voltage Terminals with Spring Clips

(1) Current-terminal block
(2) Voltage-terminal block
(3) Spring clips

The spring clips fix the terminal block in place.

Figure 5-23  Voltage Terminal with Screw Connection

Current-Terminal Block of the Modular Devices

The following transformers can optionally be installed in a current-terminal block for modular devices:

- 4 protection-class current transformers
- 3 protection-class current transformers and 1 instrument transformer
- 4 instrument transformers

Protection transformers on modular devices are transformers with a rated current of 1 A or 5 A and a device-dependent measuring range of 20 x rated current or 100 x rated current.

NOTE

You can read the type of the current transformer used on the side of the terminal block:

- C73334A 1A *7* = 4 protection-class current transformers
- C73334A 1A *8* = 3 protection-class current transformers and 1 instrument transformer
- C73334A 1A *9* = 4 instrument transformers
Current-Terminal Block for Non-Modular Devices (7xx82)

The following transformers can be installed optionally in a current-terminal block for non-modular devices:

- 4 protection-class current transformers
- 3 protection-class current transformers and 1 instrument transformer

Protection transformers on non-modular devices are transformers with a rated current of 1 A or 5 A and a measuring range of 50 x rated current.

Instrument transformers are transformers with a rated current of 1 A or 5 A and a measuring range of 1.6 x rated current. Instrument transformers are also referred to as sensitive protection transformers or sensitive ground-current transformers.

**NOTE**

You can read the type of the current transformer used on the side of the terminal block:

- C73334A 1A *5* = 4 protection-class current transformers
- C73334A 1A *6* = 3 protection-class current transformers and 1 instrument transformer

Use the cross connector for voltage terminals shown on the right in the figure below for grouping binary inputs and relay outputs.

![Cross Connector for Current (Left) and Voltage Terminals (Right)](image)

![Covering Cap for Current-Terminal Block](image)

![Covering Cap for Voltage-Terminal Block](image)

Cover caps for sealing the contacts of the terminal block can be ordered as accessories.
Terminal Designations

The current terminals have different designations in DIGSI, in the configurator, and in the device. The following table provides an overview of the different terminal designations and order numbers of the terminals.

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Configurator</th>
<th>DIGSI</th>
<th>Display on the Device</th>

</tbody>
</table>

5.7.2 Connections of Current Terminals

Fasteners

The fasteners for the transformer connection are part of the current terminal (housing side). They are made of a stress-crack and corrosion-free alloy. The head shape of the clamping screw allows the use of a DIN 5.5 x 1.0 screwdriver or a PZ2 screwdriver. Siemens recommends a PZ2 screwdriver.

Connection Elements and Conductor Cross-Sections

The following connection types are possible:
- Stranded-wire conductor with ring-type lug
- Stranded-wire conductor with bootlace ferrule
- Solid conductor

Siemens recommends the use of ring-type lugs with the dimensions shown in the following figure. Use copper cables only.

In order to maintain the insulation route, you must use insulated cable lugs or you must insulate the crimping zone (for example, by using heat-shrink tube insulation)
Siemens recommends ring-type lugs of the PIDG series made by Tyco Electronics. Use copper conductors only, at least certified for a temperature of +105 °C. Use prepared solid conductors intended for single or multi-wiring connection, maximum 2 wires per pole, and for usage of ferrules, crimped-on pressure wire connectors (ring-type and pin-type). 2 terminal lugs can be installed for each connection.

![Figure 5-28 Example of a Current Terminal with Connection of Cross Connectors and Single Cables](image)

Figure 5-28 Example of a Current Terminal with Connection of Cross Connectors and Single Cables

You can connect solid conductors as well as stranded-wire conductors with ring-type lug or bootlace ferrule. For each connection, you can install up to 2 single cables of the same type and the same cross-section. Bridges can be used as an alternative for horizontally arranged clamping points. If bridges are used, only ring-type lugs may be used.

The following cable cross-sections can be used for the connection of single cables:

<table>
<thead>
<tr>
<th>Cable cross-section</th>
<th>AWG (American Wire Gauge) 14-10</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(2.0 mm² to 4.0 mm²)</td>
</tr>
<tr>
<td>Ferrule with plastic shroud</td>
<td>L = 10 mm or L = 12 mm</td>
</tr>
<tr>
<td>Stripped length</td>
<td>15 mm</td>
</tr>
<tr>
<td>For use without ferrule</td>
<td>Use solid copper cables only.</td>
</tr>
</tbody>
</table>

**NOTE**

Always guide the solid conductor or stranded-wire conductor with bootlace from the left- or right-hand side ferrule into the terminal. Making contact from the center is not permitted.

**Mechanical Requirements**

The fasteners and their associated components are designed for the following mechanical requirements:
Permissible tightening torque at clamping screw | 2.7 Nm  
For solid conductors, the max. permissible tightening torque is 2 Nm.  
Permissible tensile force for each connected conductor | 80 N following IEC 60947-1 (VDE 660, part 100)

5.7.3 Connections of Voltage Terminals

5.7.3.1 Connections of Voltage Terminals with Spring Clips

Fasteners

The fasteners for the voltage connection are part of the voltage terminal (housing side). They are made of a stress-crack and corrosion-free alloy. The head shape of the clamping screw allows the use of a DIN 4.0 x 0.8 screwdriver or a PZ1 screwdriver. Siemens recommends a PZ1 screwdriver.

Connection Elements and Conductor Cross-Sections

The single cable connection type is available for the connection. You can connect solid conductors as well as stranded-wire conductors with and without ferrules as single cables. Siemens recommends the use of twin ferrules of series PN 966 144 made by Tyco Electronics for the connection of 2 single cables.

The following cable cross-sections can be used for the connection of single cables:

<table>
<thead>
<tr>
<th>Cable cross-section</th>
<th>AWG (American Wire Gauge) 20-14 (0.02 in² to 0.10 in²) solid or cable with UL listed ferrules</th>
<th>Use copper conductors only, at least certified for a temperature of +105 °C.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ferrule with plastic shroud</td>
<td>L = 12 mm</td>
<td></td>
</tr>
<tr>
<td>(Stripped length) for use without ferrule</td>
<td>12 mm, only copper lines may be used.</td>
<td></td>
</tr>
</tbody>
</table>

Single cables and bridges can be connected together for horizontally arranged clamping points. Note that adjacent bridges are installed reciprocally.

Mechanical Requirements

The fasteners and their associated components are designed for the following mechanical requirements:

| Permissible tightening torque at clamping screw | 1.0 Nm  
Permissible tensile force for each connected conductor | 50 N following IEC 60947-1 (VDE 660, part 100) |

5.7.3.2 Connections of Voltage Terminals with Screw Connection

For the connection of the following modules, Phoenix terminals are used (see Figure 5-23):

- Power-supply module PS203
- Plug-in module assembly with integrated power supply CB202
- Input module IO230, IO231
- Input and output module IO110
- Measuring-transducer modules ANAI

Connection Elements and Conductor Cross-Sections

The following cable cross-sections can be used for the connection of single cables:
### Mechanical Requirements

### 5.7.4 Installation and Removal

- **Switch off the device before starting work.**

**Assembly tool**

- Use a screwdriver (DIN 4 x 0.8).

**Removal**

- Use a screwdriver to carefully bend the left and right spring clips outwards.
- Carefully pull out the terminal block.
- Seal the contacts with a cover cap (see Figure 5-25 and Figure 5-26).

**Installation**

- Pull the cover cap off the terminal.
- Carefully insert the terminal block into the spring clips.
- Both spring clips must engage clearly audibly.

### High-Speed Measuring-Transducer Inputs, Voltage/Current (via IO210, IO212)

**NOTE**
Current and voltage must not be connected to a measuring-transducer input at the same time; only either current or voltage may be connected. Due to EMC, no line may be connected to an input that is not used (current or voltage).
Use shielded cables.

\(^4\) The IO210 has 4 high-speed measuring-transducer inputs. They can be used either as a voltage or as a current input.

\(^5\) The IO212 has 8 high-speed measuring-transducer inputs. They can be used either as a voltage or as a current input.
## 6.2 Supply Voltage

### Integrated Power Supply

For modular devices, the following printed circuit-board assemblies have a power supply:

- **PS201** – Power supply of the base module and of the 1st device row
- **PS203** – Voltage supply of 2nd device row
- **CB202** – Plug in module assembly with integrated power supply, for example, to accommodate communication modules

<table>
<thead>
<tr>

The binary inputs contain interference suppression capacitors. In order to ensure EMC, use the terminals shown in the terminal diagrams/connection diagrams to connect the binary inputs to the common potential.
### 6.4 Relay Outputs

#### Standard Relay (Type S)

| Switching capacity         | On: 1000 W/VA  
|                           | Off: 30 VA; 40 W ohmic;  
|                           | 30 W/VA at L/R ≤ 40 ms |
| AC and DC contact voltage  | 250 V |
| Permissible current per contact (continuous) | 5 A |
| Permissible current per contact (switching on and holding) | 30 A for 1 s (make contact) |
| Short-time current across closed contact | 250 A for 30 ms |
| Total permissible current for contacts connected to common potential | 5 A |
| Switching time OOT (Output Operating Time) | ≤ 10 ms, typically 8 ms |
| Additional delay of the output medium used | Closing time, typical: 4 ms  
|                                      | Opening time, typical: 2 ms  
|                                      | ≤ 5 ms |
| Max. rated data of the output contacts in accordance with UL certification | DC 24 V, 8 A, General Purpose  
|                                                            | DC 48 V, 0.8 A, General Purpose  
|                                                            | DC 240 V, 0.1 A, General Purpose  
|                                                            | AC 240 V, 5 A, General Purpose  
|                                                            | AC 120 V, 1/3 hp  
|                                                            | AC 250 V, 1/2 hp  
|                                                            | B300  
|                                                            | R300 |
| Interference suppression capacitors across the contacts | 4.7 nF, ± 20 %, AC 250 V |

#### Fast Relay (Type F)

| Switching capacity         | On: 1000 W/VA  
|                           | Off: 30 VA; 40 W ohmic;  
|                           | 30 W/VA at L/R ≤ 40 ms |
| AC and DC contact voltage  | 250 V |
| Permissible current per contact (continuous) | 5 A |
| Permissible current per contact (switching on and holding) | 30 A for 1 s (make contact) |
| Short-time current across closed contact | 250 A for 30 ms |
| Total permissible current for contacts connected to common potential | 5 A |
| Switching time OOT (Output Operating Time) | Closing time, typical: 4 ms  
|                                      | Opening time, typical: 2 ms  
|                                      | ≤ 5 ms |
| Rated data of the output contacts in accordance with UL certification | AC 120 V, 8.5 A, General Purpose  
|                                                            | AC 277 V, 6 A, General Purpose  
|                                                            | AC 277 V, 0.7 hp  
|                                                            | AC 347 V, 4.5 A, General Purpose  
|                                                            | B300  
|                                                            | R300 |
| Interference suppression capacitors across the contacts | 4.7 nF, ± 20 %, AC 250 V |
### Supervision

</tbody>
</table>

In order to prevent any damage, the external protection circuit must switch off the motor in case the rotor is blocked.

AC and DC contact voltage | 250 V |
Permissible continuous current per contact | 5 A |
Permissible current per contact (switching on and holding) | 30 A for 1 s |
Short-time current across closed contact | 250 A for 30 ms |
Total permissible current for contacts connected to common potential | 5 A |
Switching time OOT (Output Operating Time) | ≤ 16 ms |
Additional delay of the output medium used |
Rated data of the output contacts in accordance with UL certification |
Interference suppression capacitors across the contacts | 4.7 nF, ± 20 %, AC 250 V |
The power relays operate in interlocked mode, that is, only one relay of each switching pair picks up at a time thereby avoiding a power-supply short circuit.

### On-Site Operation Panel for Surface-Mounting Housing (Port H) (Available only for Modular Devices)

The terminal for the on-site operation panel of surface-mounted devices is located on the D-sub 15 interface (position H). The on-site operation panel of surface-mounted devices with integrated or detached on-site operation panel is connected to this interface.

#### User interface

- **Detached on-site operation panel**
  - **Connection:** On the rear side
  - **D-sub 15**

#### Insulation class
- PELV (according to IEC 60255-27)

### Integrated Ethernet Interface (Port J)

This terminal is used to load the device with DIGSI 5 using Ethernet. This terminal also enables IEC 61850 Ethernet communication or communication with another protocol via Ethernet, for example, for connecting an external RTD unit.

#### Ethernet

- **Integrated Ethernet interface**
  - **Connection:** RJ45

#### Insulation class
- SELV (according to IEC 60255-27)

Ethernet COM Link (Port K) (Available only for Modular Devices)

The Ethernet connection to the CB202 PCB assembly (plug-in module assembly with integrated power supply) is realized using the RJ45 interface.

The RJ45 interface can be used exclusively for the connection of the CB202 module. This terminal is left unused when no CB202 module is in use.

The light-emitting diodes (LEDs) signal the operating state of the communication connection. The operating states are explained in the following table:

<table>
<thead>

</tbody>
</table>

### NOTE

At an ambient temperature of 55 °C to 70 °C, a maximum of 36 relays per row may be switched on simultaneously.
**Humidity**

| Permissible humidity stress (according to IEC 60068-2-30) | ≤ 75 % relative humidity on the annual average  
Up to 93 % relative humidity on 56 days a year  
Devices subjected to condensation are not to be operated!  
Arrange the devices so that they are not exposed to direct sunlight or extreme temperature changes. This will prevent condensation in the device. |
<table>

</tr>
</tbody>
</table>
| Humid heat, cyclical | 12 h + 12 h cycles  
25 °C/55 °C/95 % relative humidity |

**Other Environmental Information**

| Maximum altitude above sea level | 2000 m (6561.68 ft) |
| Minimum admissible atmospheric pressure | 783.8 hPa |
6.10 Operating Conditions

The protection device is designed for flush mounting in conventional relay rooms and systems such that electromagnetic compatibility (EMC) is ensured with proper flush mounting.

Siemens additionally recommends:

- Use contactors and relays that work within the same cabinet or the same relay panel with digital protection equipment, only with suitable quenching equipment.

- With switchgear rated at 100 kV or higher, provide external connecting lines with shielding grounded at both ends that is capable of carrying current. No special measures are necessary in medium-voltage systems.

- Removing or plugging in individual modules under live voltage is prohibited. Some components are electrostatically sensitive in the removed state. Pay attention to the ESD specifications (Electrostatically Sensitive Devices). There is no danger for the components when they are installed.
### 6.11 Reference Conditions and Influencing Variables

#### Reference Conditions

<table>
<thead>
<tr>
<th>Measurand current $I$</th>
<th>$I_{\text{rated}} \pm 1%$</th>
</tr>
</thead>

<td>None</td>
</tr>
</tbody>
</table>

#### Variables Influencing Pickup and Dropout Thresholds (Protection)

| Auxiliary voltage: $0.8\, V_{\text{ar}}$ to $1.2\, V_{\text{ar}}$ | $\leq 0.2\%$ |
| Ambient temperature: $-10\, ^\circ\text{C}$ to $55\, ^\circ\text{C}$ | $\leq 0.5\% / 10\, \text{K}$ |
| Frequency: $45\, \text{Hz}$ to $65\, \text{Hz}$ | $\leq 1\%$ |
| Harmonics | |
| • Up to $10\%$ of $3^{\text{rd}}$ harmonics | $\leq 1\%$ |
| • Up to $10\%$ of $5^{\text{th}}$ harmonics | $\leq 1\%$ |
| Warmup | $\leq 0.3\%$ |
| Transient excess pickup in fundamental component measurement method for $\tau > 100\, \text{ms}$ (with complete unbalance) | $\leq 5\%$ |
| EMC interference | $\leq 5\%$ |

#### Variables Influencing the Measured Values (Fault Recorders)

| Auxiliary voltage: $0.8\, V_{\text{ar}}$ to $1.2\, V_{\text{ar}}$ | $\leq 0.2\%$ |
| Ambient temperature: $-10\, ^\circ\text{C}$ to $55\, ^\circ\text{C}$ | $\leq 0.5\% / 10\, \text{K}$ |
| Frequency: $45\, \text{Hz}$ to $65\, \text{Hz}$ | $\leq 1\%$ |
| Harmonics | |
| • Up to $10\%$ of $3^{\text{rd}}$ harmonics | $\leq 1\%$ |
| • Up to $10\%$ of $5^{\text{th}}$ harmonics | $\leq 1\%$ |
| Warmup | $\leq 0.3\%$ |
| Transient excess pickup in fundamental component measurement method for $\tau > 100\, \text{ms}$ (with complete unbalance) | $\leq 5\%$ |
| EMC interference | $\leq 1.5\%$ |

---

7 Use shielded cables for the current and voltage measuring inputs on the fault recorder.

### Minimum Bending Radii of the Connecting Cables Between the On-Site Operation Panel and the Base Module

- **Fiber-optic cable**
  - R = 50 mm
  - Pay attention to the length of the cable protection sleeve, which you must also include in calculations.

- **D-Sub cable**
  - R = 50 mm (minimum bending radius)

### Degree of Protection According to IEC 60529

- **For equipment in the surface-mounting housing**
  - Front IP54

- **For equipment in the flush-mounting housing**
  - Front IP54

- **For operator protection (back side)**
  - IP2x for current terminal (installed)
  - IP2x for voltage terminal (installed)

- **Degree of pollution, IEC 60255-27**
  - 2

- **Maximum altitude above sea level**
  - 2000 m (6561.68 ft)

### UL Note

- Type 1 if mounted into a door or front cover of an enclosure.
- When expanding the device with the 2nd device row, then they must be mounted completely inside an enclosure.

6.14 Assembly Dimensions

Flush-Mounting Device

Figure 6-1  Cut-Out Widths and Drilling Pattern - 1/3 Device, 1st Device Row
6.14 Assembly Dimensions

Figure 6-2  Cut-Out Widths and Drilling Pattern - 1/2 Device, 1st Device Row

Dimensions in mm. Values in brackets in inches.
Figure 6-3  Cut-Out Widths and Drilling Pattern - 2/3 Device, 1st Device Row
Figure 6-4  Cut-Out Widths and Drilling Pattern - 5/6 Device, 1st Device Row

Figure 6-5  Cut-Out Widths and Drilling Pattern - 1/1 Device, 1st Device Row
All drillings in the area of the specific device cut-out widths (see Table 6-6) must comply with the dimensions in the corresponding figures.

Figure 6-6  Cut-Out Widths and Drilling Pattern - 1/3 Device, 2nd Device Row
Figure 6-7  Cut-Out Widths and Drilling Pattern - 1/2 Device, 2nd Device Row

Figure 6-8  Cut-Out Widths and Drilling Pattern - 2/3 Device, 2nd Device Row
Figure 6-9  Cut-Out Widths and Drilling Pattern - 5/6 Device, 2nd Device Row

Figure 6-10  Cut-Out Widths and Drilling Pattern - 1/1 Device, 2nd Device Row
Siemens recommends a drilling space of at least 55 mm (2.17 in) between the 1st and the 2nd device row. Due to the connecting-cable length, the maximum space may be approx. 80 mm (3.15 in).

7 Ordering Information

7.1 Ordering Spare Parts and Accessories
7.1 Ordering Spare Parts and Accessories

7.1.1 Order Configurator and Order Options

Order Configurator

The order configurator assists you in the selection of SIPROTEC 5 products. The order configurator is a Web application that can be used with any browser. The order configurator can be used to configure complete devices or individual components, such as communication modules, expansion modules, or other accessories. At the end of the configuration process, the product code and a detailed presentation of the configuration result are provided. The product code unambiguously describes the selected product and also serves as an order number.

Ordering Options

The following ordering options are possible for SIPROTEC 5 products:

- Device
- Single part
- DIGSI 5
- Functional enhancement

NOTE
To order single parts in the order configurator, use the Single part link.

Individual parts are:

- Replacement base module
- Expansion module
- Plug-in module
- Sensors for arc protection
- Operation panel
- Terminal
- Accessories

7.1.2 Ordering Accessories

NOTE
To order terminals, terminal accessories, and mechanical accessories in the order configurator, use the Single part link.

Glossary

Control display
The control display becomes visible for devices with a large display after pressing the Control key. The diagram contains the switching devices to be controlled in the feeder. The control display serves for implementing switching operations. Specification of this diagram forms part of configuring.

DCF77
The precise official time is determined in Germany by the Physikalisch-Technische Bundesanstalt PTB in Brunswick. The atomic clock unit of the PTB transmits this time via the long-wave time signal transmitter in Mainflingen near Frankfurt/Main. The emitted time signal can be received within a radius of approx. 1500 km from Frankfurt/Main.

GOOSE
Generic Object-Oriented Substation Event

Ground
The conductive ground whose electric potential can be set equal to 0 at every point. In the area of grounding conductors, the ground can have a potential diverging from 0. The term reference ground is also used for this situation.

Grounding
The grounding is the entirety of all means and measuring for grounding.

IEC
International Electrotechnical Commission

Parameterization
Comprehensive term for all setting work on the device. You can parameterize the protection functions with DIGSI 5 or sometimes also directly on the device.

Protection Device
A protection device detects erroneous states in distribution networks, taking into account various criteria, such as error distance, error direction or fault direction, triggering a disconnection of the defective network section.

RSTP
Rapid Spanning Tree Protocol

SNMP
Simple Network Management Protocol

SNTP
Simple Network Time Protocol
